Human-like experiences require memory

Top three reasons why bringing memory to Alexa is a good idea

Personalized experience

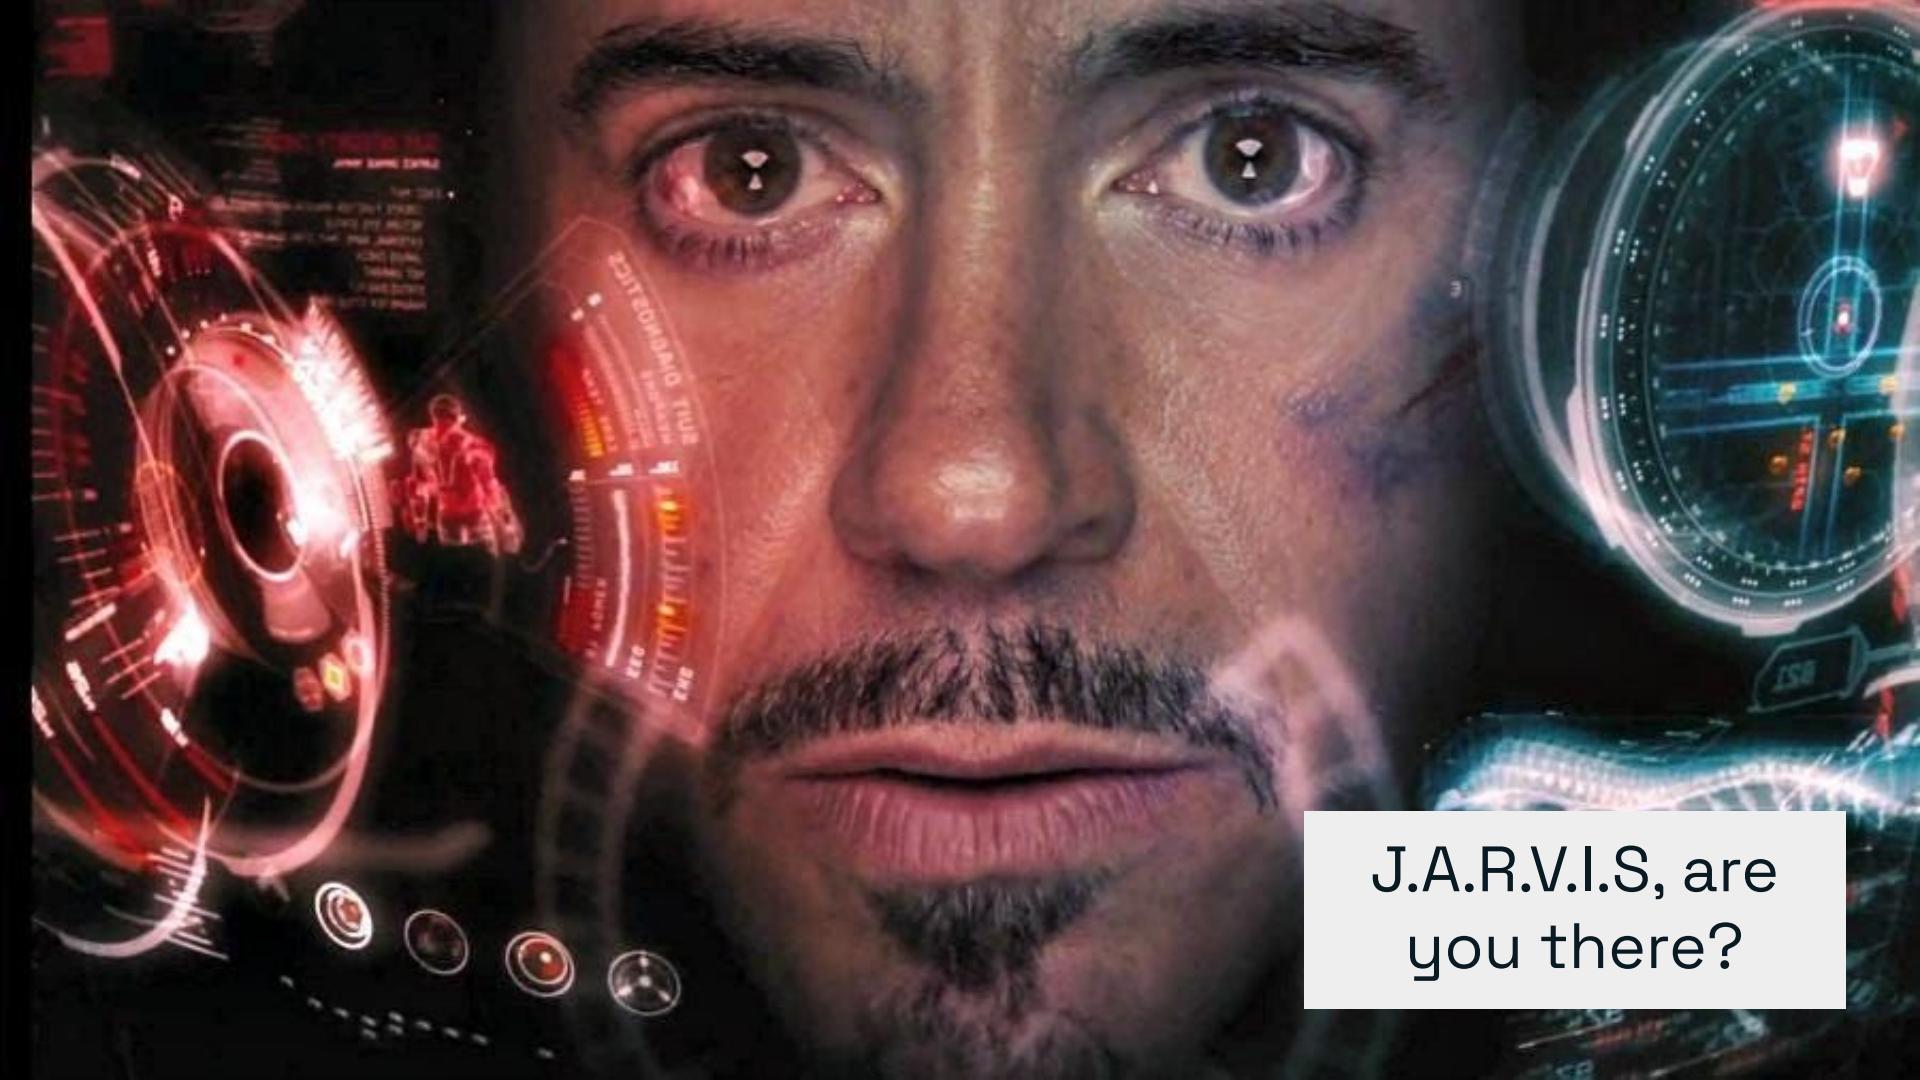

- Learns the user's routine and make better recommendations
- It knows you, your family, and each one's weekly agenda
- Suggests products, music, and content based on past data

Continuous conversations

- "Alexa, add to the list what we discussed yesterday morning"
- Never have to explain the same medical condition all over again
- Talk like you would with a human that knows your past

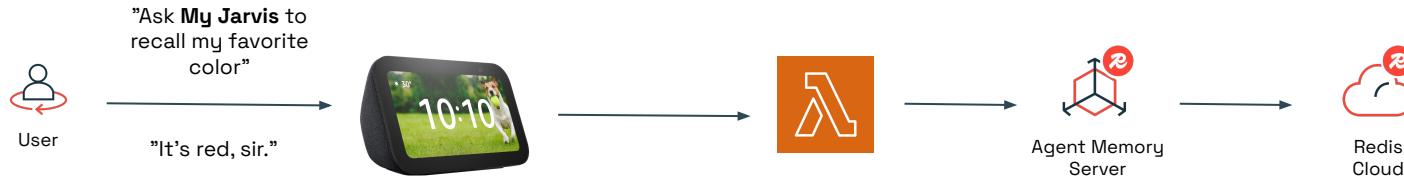

Productivity multiplier

- With a living knowledge base acting like a encyclopedia
- Reminds you about one-off and recurring appointments that came out of recorded memories
- Monitor your progress on tasks like fitness or financial goals

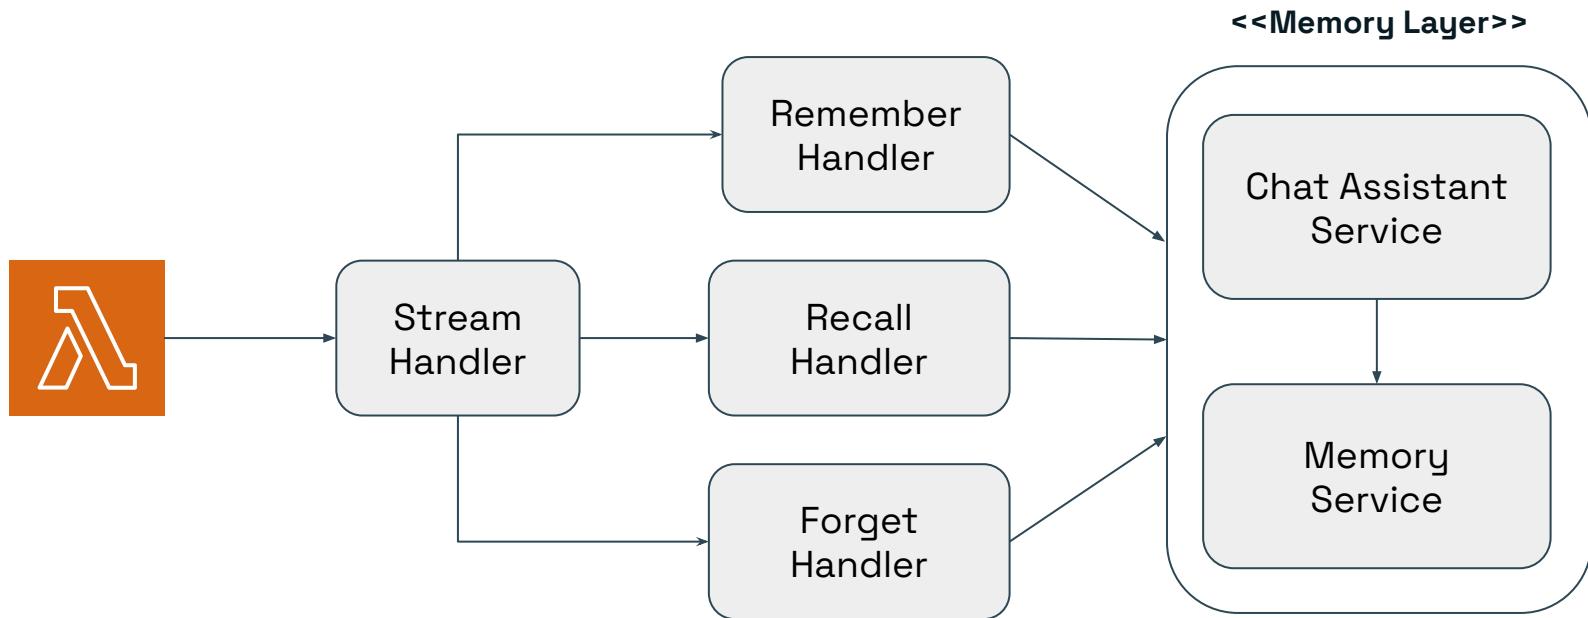

A close-up photograph of Tony Stark's face, looking directly at the camera with a serious expression. His eyes are brown and have glowing red highlights. A complex, glowing red and blue digital interface is overlaid on the left side of his face, showing various data, a small figure, and circular patterns. On the right side, there is a large, illuminated circular display showing a map or sensor读数. The overall aesthetic is high-tech and futuristic.
